## APJ ABDUL KALAM TECHNOLOGICAL UNIVERSITY

THIRD SEMESTER B.TECH DEGREE EXAMINATION(S), MAY 2019

# Course Code: CH201 <br> Course Name: CHEMICAL PROCESS CALCULATIONS 

Max. Marks: 100
Duration: 3 Hours

## (Attested copy of Humidity chart is permitted) PART A <br> Answer any two full questions, each carries 15 marks.

## Marks

1 a) If the volumetric flow rate of a liquid of specific gravity 0.78 is $100 \mathrm{ft}^{3} / \mathrm{min}$, find the flow rate in $\mathrm{kg} / \mathrm{s}$.
b) A solution of KCl in water contains 384 g KCl per litre of the solution at 300 K . The specific gravity of the solution is 1.6 . Determine the following. (i) The concentration in weight percent, (ii) molarity of the solution (iii) molality of the solution (iv) normality of the solution.
c) Differentiate between unit operations and unit processes. Write examples.

2 a) A flue gas contains $\mathrm{CO}_{2}-14 \%, \mathrm{SO}_{2}-0.5 \%, \mathrm{CO}-2 \%, \mathrm{O}_{2}-2.5 \%$ and rest $\mathrm{N}_{2}$ by volume. Find (i) composition by weight (ii) average molecular weight of the gas mixture (iii) density of gas mixture at 320 K and 1.5 bar (iv) specific gravity of the gas mixture at 320 K and 1.5 bar.
b) A compound whose molecular weight is 103 , analyses $\mathrm{C}=81.5 \%, \mathrm{H}=4.9 \%$ and $\mathrm{N}=13.6 \%$. Determine its molecular formula.
3 a) $250 \mathrm{~m}^{3}$ of $30{ }^{0} \mathrm{API}$ gas oil is blended with $1000 \mathrm{~m}^{3}$ of $15^{0} \mathrm{API}$ fuel oil. Determine the density of the resultant mixture in $\mathrm{kg} / \mathrm{m}^{3}$. The density of water at 288.5 K is $999 \mathrm{~kg} / \mathrm{m}^{3}$. Assume no volume change on mixing.
b) For fluids in turbulent motion through tubes, the heat transfer coefficient is given by,

$$
h=a\left(\frac{C_{p} G^{0.8}}{D^{0.2}}\right)
$$

The numerical value of the constant $\mathrm{a}=10.1$, when ' h ' is measures in $B t u /\left(f t^{2} . h^{\circ} F\right), C_{p}$ is the specific heat of the fluid given in $B t u /\left(l b .^{\circ} F\right), G$ is the mass velocity in $l b /\left(f t^{2} . s\right)$ and the diameter is in $f t$. determine the value of ' $a$ ' when ' $h$ ' is measured in $W /\left(m^{2} . K\right), \mathrm{Cp}$ is the specific heat of the fluid given in $\mathrm{kJ} /(\mathrm{kg} . \mathrm{K}), G$ is the mass velocity in $\mathrm{kg} /\left(\mathrm{m}^{2} . s\right)$ and the diameter in $m$.

## PART B

Answer any two full questions, each carries 15 marks.
4 a) Define Humid heat and Humid volume.
b) At 300 K , the vapour pressures of two pure liquids A and B are 80 kPa and 50 kPa respectively. The concentration of $A$ in vapour in equilibrium with a solution of $A$ and B is found to $35 \%$ in mole basis. Calculate (a) The composition of the liquid (b) The total pressure of the vapour.
c) The percent saturation of a mixture of acetone vapour and nitrogen at 105 kPa and 300 K is found to be $80 \%$. The vapour pressure of acetone is given by the Antoine equation with constants, $\mathrm{A}=14.5463, \mathrm{~B}=2940.46$ and $\mathrm{C}=49.19$. Determine (i) molal humidity (ii) absolute humidity, (iii) partial pressure of acetone (iv) relative saturation and (v) dew point.

5 a) What is steam distillation? Write its applications.
b) An air-water vapour sample at 101.3 kPa has a dry bulb temperature of 333 K and an absolute humidity of 0.01 kg water vapour per kg dry air. Using the Humidity chart, determine (i) Percent saturation (ii) partial pressure of water vapour (iii) Percent relative saturation (iv) dew point of the system (v) wet bulb temperature.
c) Soya been seeds are extracted with n-hexane in batch extractor. The flaked seed contains $18.6 \%$ oil, $69 \%$ solids and $12.4 \%$ moisture. At the end of the extraction process, de-oiled cake (DOC) is separated from n-hexane -oil mixture. DOC analysis yields $0.8 \%$ oil, $87.7 \%$ solids and $11.5 \%$ moisture. Find the percentage recovery of oil. All percentages are by mass.

6 a) 1000 kg of a $30 \%$ solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}$ in water is cooled slowly to a temperature at which salt crystallizes out as $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot 10 \mathrm{H}_{2} \mathrm{O}$. The solubility of anhydrous $\mathrm{Na}_{2} \mathrm{CO}_{3}$ in water at this temperature is $25 \mathrm{~kg} / 100 \mathrm{~kg}$ of water. During cooling, $20 \%$ of the water originally present is evaporated. Determine mass of $\mathrm{Na}_{2} \mathrm{CO}_{3} \cdot 10 \mathrm{H}_{2} \mathrm{O}$ precipitated.
b) $4000 \mathrm{~kg} / \mathrm{hr}$ caustic solution containing $10 \mathrm{wt} \% \mathrm{NaOH}$ is evaporated in the first evaporator of a double effect evaporator, giving a $20 \mathrm{wt} \% \mathrm{NaOH}$ solution. The solution is then fed into a second evaporator, which gives a product of $50 \%$ NaOH . Calculate (i) amount of water evaporated from each evaporators and (ii) amount of product in $\mathrm{kg} / \mathrm{hr}$.

PART C
Answer any two full questions, each carries 20 marks.
7 a) Differentiate between the Proximate and Ultimate analysis of Coal
b) The Orsat analysis of the flue gas resulting from the combustion of a hydrocarbon fuel is found to be $1 \% \mathrm{CO}, 10.2 \% \mathrm{CO}_{2}, 8.4 \% \mathrm{O}_{2}$ and $80.4 \% \mathrm{~N}_{2}$. Determine the atomic ratio of H to C in the fuel.
c) A solid fuel has the following analysis. H-5\%, S-4\%, C-65\%, O-10\% and rest inerts. The fuel is burned with $20 \%$ excess air. If only $80 \%$ of the carbon burned gets converted to $\mathrm{CO}_{2}, 15 \%$ is converted to CO and $5 \%$ left behind as soot, determine the composition of combustion gases.

8 a) Develop energy balance equation for a flow steady state process.
b) The molal heat capacity of $\mathrm{CO}_{2}$ gas is given by

$$
\mathrm{C}_{\mathrm{p}}=26.54+42.454 \times 10^{-3} \mathrm{~T}-14.298 \times 10^{-6} \mathrm{~T}^{2}
$$

where $C_{p}$ is in $\mathrm{kJ} /(\mathrm{kmol} . \mathrm{K})$ and T in K . Determine (i) The mean molal heat capacity between 500 K and 1000 K (ii) The heat required to raise the temperature of $200 \mathrm{~m}^{3}$ per hour of $\mathrm{CO}_{2}$ gas at STP from 500 to 1000 K .
c) Pure CO is mixed with $100 \%$ excess air and completely burnt at constant pressure. The reactants are originally at $95{ }^{\circ} \mathrm{C}$. Determine heat added or removed if the product temperature is $260{ }^{\circ} \mathrm{C}$.

Standard heat of reaction is $-67600 \mathrm{cal} / \mathrm{gmol}$.
$\mathrm{C}_{\mathrm{pm}}$ data $\left(\mathrm{cal} / \mathrm{gmol} .{ }^{0} \mathrm{C}\right.$ ) : $\mathrm{CO}=6.95, \mathrm{O}_{2}=7.1, \mathrm{~N}_{2}=6.95$ and $\mathrm{CO}_{2}=9.9$
9 a) Define theoretical flame temperature.
b) Sulphur dioxide gas is oxidised in $100 \%$ excess air with $80 \%$ conversion to $\mathrm{SO}_{3}$. The gases enter the converter at 673 K and leave at 723 K . The mean heat capacities of $\mathrm{SO}_{2}, \mathrm{SO}_{3}, \mathrm{O}_{2}$ and $\mathrm{N}_{2}$ are $45,51,32$ and $31 \mathrm{~J} /(\mathrm{mol} . \mathrm{K})$ respectively and the standard heat of reaction is $-98.8 \mathrm{~kJ} / \mathrm{mol}$. Determine the amount of heat absorbed in the heat exchanger of the converter per kilo mole of $\mathrm{SO}_{2}$ introduced.
c) Dry methane is burned with dry air. Both reactants are at 298 K initially. The flame temperature is 1573 K . Determine the amount of air used, assuming complete combustion. Standard heat of reaction is $-802.8 \mathrm{~kJ} / \mathrm{mol}$. Mean molal heat capacities of gases between 298 K and 1573 K are 51.88 for $\mathrm{CO}_{2}, 34.01$ for $\mathrm{O}_{2}$, 40.45 for $\mathrm{H}_{2} \mathrm{O}$, and 32.21 for $\mathrm{N}_{2}$.
